A: To solve this you need to run the following command and delete old logfiles. `sudo rm -rf /var/cpanel/error_log /var/cpanel/session_error_log` After that you can re-install cPanel & WHM.

Restart your server and check the logs. A number of electronic devices, such as handheld electronic devices and automobiles, are surrounded by electromagnetic radiation fields to some extent. The electronic devices are frequently interfered with by the electromagnetic radiation fields. An electronic component of a circuit board

of the electronic device, being, for example, a gate driver of a power switch or a power supply capacitor of a DC/DC converter, may be directly affected by a high current-conducting electromagnetic radiation field generated by a power supply or electromagnetic radiation field generated by a relatively high frequency noise (such as 50 Hz, 60 Hz or other frequencies) superimposed on an output voltage. When the power switch of the electronic device is turned on or off, the electronic component is usually affected and a current of, for example,

15 A of the electronic component is generated when the power switch is turned on. Since the current of 15 A is usually heavy and a generation threshold of the gate driver is 0.5 A, the power switch needs to have a very large capacity. Moreover, when the power supply is turned on, the current of 15 A of the electronic component also needs to be limited in order to prevent an overheat of the power switch.

Currently, a number of gate driver schemes have been proposed. For example, Chinese Patent Application Publication No. CN102272242A

discloses a circuit topology for a gate driver. However, when the power switch is turned on, a spike current may be generated due to a relatively high voltage drop of the gate driver during current conduction, which is disadvantageous for protecting the power switch and the electronic component of the circuit board.

Chinese Patent Application Publication No. CN101048852A discloses a circuit topology for a gate driver. When a voltage of a voltage source for a power switch increases to a certain voltage and a current of a current source for a gate

driver is low, the gate driver outputs a high control signal, and when the voltage of the voltage source is further increased and the current of the current source is further increased, the gate driver outputs a low control signal. The control signal is used to control a power switch. However, the gate driver of the circuit top 3ef4e8ef8d
