

The topic of that article: The best German F1 German. Von hinnen aus bekommen wir alles kostenlos.[Detection of urokinase plasminogen activator and plasminogen activator inhibitor-1 in pancreatic cancer and its significance]. To investigate the involvement of plasminogen activator and its inhibitor in the development and metastasis of pancreatic cancer. The activity of urokinase plasminogen activator (uPA) and plasminogen activator inhibitor-1 (PAI-1) in pancreatic cancer and its adjacent pancreatic tissues was detected by uPA activity assay kit and recombinant PAI-1 kits, respectively. The mRNA and protein expression of uPA, PAI-1 and PAI-1-Ag in pancreatic cancer and its adjacent pancreatic tissues were detected by real-time polymerase chain reaction (RT-PCR) and immunohistochemistry. The activity of uPA and PAI-1 was lower and the mRNA and protein expression of uPA and PAI-1 were higher in pancreatic cancer tissues than in their adjacent normal pancreatic tissues. The uPA activity, mRNA and protein expression of uPA were significantly correlated with PAI-1 activity and mRNA and protein expression of PAI-1. The expression of uPA and PAI-1 was lower in the early-stage (I-II) of pancreatic cancer than in the advanced stage (III-IV) of cancer. The activity of uPA was significantly correlated with PAI-1 activity in both pancreatic cancer and its adjacent pancreatic tissues. PAI-1 activity was negatively correlated with PAI-1 mRNA and protein expression in pancreatic cancer tissues, while was positively correlated in their adjacent pancreatic tissues. The activity of uPA was negatively correlated with PAI-1 activity in the adjacent pancreatic tissues of pancreatic cancer. The activity of uPA and PAI-1 was decreased in pancreatic cancer and in its adjacent tissues. The correlation of PAI-1

with PAI-1 mRNA and protein expression in pancreatic cancer and its adjacent tissues was not found. uPA and PAI-1 are involved in the invasion and metastasis of pancreatic cancer, and in the process of malignant transformation of pancreatic cancer cells. PAI-1 may play a role in inhibiting the invasion and metastasis of pancreatic cancer.
