Keymacro is a macro recorder, recorder and editor for the Windows operating system. It is available as a Windows application for Windows 8 and later and as a stand-alone application for Windows 7 and later. In the free version of the software, you can record up to 12 macros, while in the paid version, you can record up to 60. What is it? The software records keystrokes on your keyboard and allows you to convert them into macros. When the software is installed, you are given the option to record a macro key that you have assigned. Press the assigned macro key to record a specific keyboard stroke. You can then replay the recorded macros as often as you like. You can use macros for instance to open applications, navigate through the Windows file explorer, invoke an action such as double-clicking or change options such as view, layout, and so on. You can set the recorded macro to open a file, a folder, a folder or a document. After the recording is done, you can edit the macro code, as well as add comments and create favorites. You can also make the recorded macros run when you launch a program or select a file. The software allows you to assign actions to the recorded macros in different ways. What's more, you can associate a command with each macro, making it possible to complete the recorded macro from the command line or the keyboard. For instance, you can record a macro to open a folder, then send the recorded macro to the command line, where you can execute the associated command. How to install and use As the software is a standalone application, there is no requirement for an installation. Simply run the EXE file from the Windows Start menu or Desktop. The application opens to the main interface with four tabs at the bottom. The first is used to create macros and edit macros. The second one is used to play and edit a macro, while the other two are used to configure macros. In the first tab, you can set the length of the macro recording and access the recorded macros. You can choose whether to include or exclude keystrokes, which are defined using Ctrl+Alt, Ctrl+Shift, Ctrl+Alt or Alt+Ctrl. Alt+Shift, and Alt keys. You can also use arrows and enter keys to navigate. You can then insert comments at any point in the macro and you can add Favorites to the macro. You can also set macros to run immediately upon launching a program or select a file
